

## **EXHIBIT A**

### **WDN Intellectual Property Rights**

**Technology and Intellectual Property.** WDN's intellectual property portfolio includes issued patents, pending patent applications, software and key URLs that enable launching wireless directory assistance within three to six months of carrier acceptance. The core technologies covered in the patents and patent applications listed below are:

**Digital Wireless Directory Assistance** – A computer-based system for gathering, storing and transmitting contact information for wireless communication devices. The system includes a network station for compiling contact information received from wireless communication service providers. The compiled information is periodically updated and transmitted upon request. The system can be accessed by interface facilitators as well as by individuals interested in obtaining contact information, such as, for example, the calling number for a particular cell phone.

**ComNote®** – A system and method in which unpublished subscribers of telecommunications services are able to receive a notification that an individual is trying to contact them, without revealing unpublished contact information. A requestor of a telecommunication subscriber's unpublished contact information is given an opportunity to indirectly send the subscriber a notification message. This is accomplished by collecting information from the requestor regarding the desired content of the notification message and then sending the notification message to the subscriber. The unpublished subscriber receiving such a notification message has the choice of contacting the requestor or ignoring the notification message.

Our patent portfolio is summarized in the following tables. The license would include those patents and patent applications necessary for operation of the WDN System in Spain. References to other patents and patent applications are included for informational purposes only and are not intended to be included in the license.

**System for Storing and Supplying Wireless Contacts Information  
(Wireless DA Patent)**
